## Introduction

This is a brief summary of the course TMA4267 about linear statistical models. It includes the main content from the lecture held by ... recorded in, where some examples etc... are excluded.

The purpose of the notes is to give a good overview of the syllabus. I intend to add summaries of the lectures as I review them. I hope to include insights from projects / exercises where it is appropriate.

### Keywords to know

### Part 1 -

 $\widehat{\boldsymbol{\beta}}, \, \boldsymbol{\beta}, \, \boldsymbol{\sigma}, \, \widehat{\boldsymbol{\sigma}}, \, \boldsymbol{\varepsilon}, \, \widehat{\boldsymbol{\varepsilon}}$ 

$$\widehat{\beta}$$
,  $\beta$ ,  $\sigma$ ,  $\widehat{\sigma}$ ,  $\varepsilon$ ,  $\widehat{\varepsilon}$ 

theorem - trace formula

Theorem 1. (Trace formula)

$$\varepsilon(Y^TCY) = \operatorname{tr}(C\Sigma) + \mu^TC\mu$$

*Proof.* TODO:

theorem - ...

#### Lecture 8

**Theorem 2.**  $\mathbf{Z} \sim N(0, I)$  and  $\mathbf{R}$  symmetric and idempotent of rank r. Then

$$oldsymbol{Z}^T oldsymbol{R} oldsymbol{Z} \sim \chi_r^2.$$

#### Lecture 9

Assumptions

- 1.  $\boldsymbol{X}$  is of cull column rank
- 2.  $E\boldsymbol{\varepsilon} = \mathbf{0}$
- 3. Homostochastic:  $Var(\varepsilon_i) = 0 \quad \forall i$ .
- 4. If X is random, then 2 and 3 are conditioned on X.
- 5. Normality of errors:  $\varepsilon \sim N(0, \sigma^2 I_n)$ .

... obtain least squares estimators  $\widehat{\pmb{\beta}}, \widehat{\pmb{\sigma}}^2$  of  $\pmb{\beta}, \pmb{\sigma}^2$ 

Residuals ...

#### Parameter estimation

Two approaches: LSE and MLE ...

$$\widehat{oldsymbol{eta}} = rg \min_{oldsymbol{eta} \in \mathbb{R}^{k+1}} \sum_{i=1}^n (Y_i - oldsymbol{x}_i^T oldsymbol{eta})^2$$

... deducing that LSE and MLE give the same result ...

#### Lecture 12

questions about independence. Detour into sigma algebras etc ...

**Theorem 3.** Suppose X, Y are independent random variables and that f, g are two measurable functions. Then f(X), g(Y) are also independent.

ANOVA - Analysis of variance

**Theorem 4.** (ANOVA decomposition) Assuming the necessarry assumptions,

$$\underbrace{\sum_{i=1}^{n} (Y_i - \bar{Y})}_{\text{SST}} = \underbrace{\sum_{i=1}^{n} (\hat{Y}_i - \bar{Y})}_{\text{SSR}} + \underbrace{\sum_{i=1}^{n} (Y_i - \hat{Y}_i)^2}_{\text{SSE}}.$$

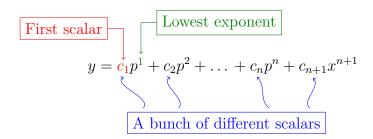

*Proof.* TODO: there aint space in the margin

R2 score ...

#### Lecture 13

#### Fictional model

"Fictional model" using  $x_{ij}$  as response for some fixed feature j.

... TODO:

#### General F-test

We set up a much more general problem. Let  $A \in \mathbb{R}^{r \times p}$ , r < p, rank(A) = r,  $\mathbf{d} \in \mathbb{R}^d$ . We test the hypothesis:

$$H_0: A\boldsymbol{\beta} = \boldsymbol{d}, \qquad \quad H_1: A\boldsymbol{\beta} \neq \boldsymbol{d}.$$

Some special cases of this general setup are.

1. r = 1, d = 0, A = (0, ..., 1, ..., 0) with 1 at index i, gives the test

$$H_0: \beta_i = 0, \qquad H_1: \beta_i \neq 0.$$

2.  $r = 1, d = 0, A = (0, \dots, 1, \dots, -1, \dots, 0)$  with 1 at index i and -1 at index j, gives the test  $H_0: \beta_i = \beta_j, \qquad H_1: \beta_i \neq \beta_j.$ 

3.  $r = k, d = \mathbf{0} \in \mathbb{R}^k, A = (\mathbf{0}, \operatorname{diag}(1)) \in \mathbb{R}^{k \times p}$ , gives the test  $H_0: \beta_i = 0 \quad \forall i \in \{1, \dots, k\}, \qquad H_1: \beta_i \neq 0 \text{ for some } i \in \{1, \dots, k\}.$ 

#### Lecture 14

Let  $\mathcal{B}$  be the space of  $\boldsymbol{\beta}$  satisfying  $H_0$ . The restricted problem is:

$$\widehat{\boldsymbol{\beta}}^R = \underset{\boldsymbol{\beta} \in \mathcal{B}}{\operatorname{arg min}} (\boldsymbol{Y} - \boldsymbol{X}\boldsymbol{\beta})^T (\boldsymbol{Y} - \boldsymbol{X}\boldsymbol{\beta}).$$

Using lagrange multipliers and a bag of tricks, we obtain:

$$\widehat{\boldsymbol{\beta}}^R = \widehat{\boldsymbol{\beta}} - (\boldsymbol{X}^T \boldsymbol{X})^{-1} \boldsymbol{A}^T (\boldsymbol{A} (\boldsymbol{X}^T \boldsymbol{X})^{-1} \boldsymbol{A}^T)^{-1} (\boldsymbol{A} \widehat{\boldsymbol{\beta}} - \boldsymbol{d}).$$

Denoting  $\Delta = \widehat{\boldsymbol{\beta}} - \widehat{\boldsymbol{\beta}}^R$ , we find:

$$SSE^R = SSE + \Delta^T \boldsymbol{X}^T \boldsymbol{X} \Delta$$

... IMPORTANT: the concrete expressions for the F statistic...

We claim that the under  $H_0$ , we have

$$F = \frac{SSE^R - SSE/r}{SSE/(n-p)} \sim F_{r,n-p}.$$

*Proof.* what the

#### Lecture 15

... example ...

#### Transformations of data

Motivation: ...

box cox transformation

variance stabilising transformation

Suppose  $\mu = \varepsilon(Y_i)$  and that  $Var(Y_i)$  depends on  $\mu$ . ...

#### Lecture 16

...

### Lecture 17

Suppose k covariates. Then  $2^k$  possible models from maximal:

$$Y_i = \beta_0 + \beta_1 x_{i1} + \dots + \beta_k x_{ik}.$$

to minimal:

$$Y_i = \beta_0$$
.

We want to arrive at a compromise between simplisity and goodness of fit.

1. Adjusted coefficient of determination:

$$R_{\text{adj}}^2 = 1 - \frac{\text{SSE}/(n-k-1)}{\text{SST}/(n-1)}$$

- 2.
